Edit the index.htm page for the root and add this:

```
<meta name="refresh" content="0;url=http://www.abc.com/exchange/>
```

Nick

OK I have a default web site where OWA is located and is running good.

Let's say I am hosting abc.com. Is there a way I can tell through a header in abc or in the default web site or other method that if the person goes to abc.com/exchange that it will be directed to OWA.

Kelly
