The answer is correct. When you setup a contact you have to select an Exchange alias and this will cause the RUS to stamp the email addresses onto this object. However, if you setup an external email address this will be listed as the primary address. You could certainly add multiple addresses to the contact object.

Am studying towards my 284 exam and am confused as i thought i understood the uses of contacts but the below has thrown me.

I thought you must not use contacts for internal users as the messages bounce

when setting up the contact does it matter which mail address you use "do you have to use the company.com to list it in ad so it delivers inbound mail"

answer states use two mail addresses in contact if i add 10 addresses to the contact will they all receive a copy of the message sent to brian@xxxxxxxx automatically.

QUESTION: your company subcontracts a consultant named brian to develop a new project. brian works from his private office and he has an internet based email address Brian@xxxxxxx, that is provided by his isp. after the project is completed brian must respond to technical support incidents that are reported by your companys customers. company management does not want the customers to know brians internet mail address. the customers should address their mail messages with technical support incidents to an email address brian@xxxxxxxx brian should not be allowed to access any resources on your companys network. you must accomplish this task with the least amount of administrative effort.

ANSWER: Create a mail-enabled contact object named brian. specify two smtp addresses for the contact: brian@xxxxxxxx and brian@xxxxxxx

Thanks for any help with these
