Instead of having it archive external mail before it reaches Exchange, you could enable message journaling on Exchange (both internal and internet mail), and point it to a mailbox on your external provider's system. This will take care of both types of mail using one, consistent journaling system.

Thanks guys.

It was possible in Exchange 5.5 because there were actually two settings required.

1. Route external mail through the internal mail store
2. Journal messages on the internal mail store

By setting only the second step, external email was not routed through the internal store and was therefore not journaled. I thought there may be a similar distinction "under the covers" of exchange 2000/3.

Just to clarify, there aren't two separate archives. The external gateway archives external email. I need to send internal email to the external gateway via journaling. The problem is that if journaling sends both internal and external I'll end up with duplicates in the archive.

You can't do this using any built-in tools or configuration short of a Store

Re: Journal internal mail only

event sink.

Hello all,

On Exchange 5.5 (via registry hacks) I was able to configure message journaling to affect ONLY internal email. That is, only messages which do NOT go to or come from the outside world are journaled.

On exchange 2000/2003 this appears to have changed. I can tick a box to archive ALL messages sent through a mail store, but I need to ONLY archive/journal internal messages.

The reason for this is that we have a gateway service which archives all external mail. I need to send ONLY internal email to the gateway archive system.

Does anyone know how to configure exchange 2000/2003 to archive/journal only internal messages? (without writing any event sinks etc).

Ideally I need to do this with just configuration, not any code installed on the exchange server.

Thanks.
