You're not populating the mailNickname attribute.

Additionally, here's what I have in an old script:

"internetEncoding","1310720"

"mAPIRecipient","False"

This ensures an attachment can be sent to Contact.

Hi,

Sorry if this is not the correct discussion group.

I am trying to import thousands of contacts into AD2003 so users can select them from the address list that I have created.

Here are the fields I am using:

DN,CN=paul smith,OU=Test Contacts,DC=SE,DC=TEST,DC=LOCAL

ObjectClass,contact

givenName,Paul

mail,paul.smith@xxxxxxxxxxx

sn,smith

DisplayName,smith paul

company,Testing Co

targetAddressSMTP:paul.smith@xxxxxxxxxxx

Re: LDAP attributes for importing contacts

The contacts are created and all appear in address list filtered by company name. When I select the contact from AD computer and users right click send mail, mail is sent no problems. When the contact is selected from the address list it fails to be sent.

any ideas?

Thanks
