I have a Windows 2003/Exchange 2003 set up where both are fully Service Packed and seem to be running without issue. At the same site on a second server Windows 2000 is running with the main purpose of running Good Link Software to connect several Trio Phones (similar to BlackBerry Server). Several times a day at irregular intervals the 2nd server shows these errors. The user changes and appears to involve all of the mobile device users, so I don't think it is specific to a Mailbox or single user configuration.

I do have the management tools for Exchange 2003 loaded on the 2nd server, as we use it quite a bit for remote management, etc. Any thoughts on this?

Event Type: Warning
