It is possible with SP2 to now propagate permissions, however if you did not create one root folder at the top then you're stuck since you cannot apply permissions at the Public Folder virtual tree. If you do not have many root folders that you it's ok, if you have many then you will have to use Pfdavadmin to perform a custom bulk operation which you can do at the Public Folder Tree.

So this is definitely possible with SP2? If so I will wait because we are applying that real soon.

can you give me some steps or point me to some documentations please

The pfdavadmin documentation is quite good.
Note also that if apply SP2 to Exchange, there are some improvements with the pf settings wizard that may eliminate the need to use pfdavadmin.

I just need to add one group
to all the public folders
without changing any
other permissions. Cna this
be done with
PFDAVADMIN.EXE?

I am running Exchange
server 2003 with SP1.

Thanks,
