Configure "Send As" rights rather than "Send on Behalf" Go to properties of your ableandable MB. Go to the security tab. Add your users and give them the "Send As" rights. If you do not see the security tab, go to view and click advanced settings in your AD console. Try this first and see if your second issue goes away .

Exchange gurus,

I am running Exchange 6.5 build 7638.2 on windows server 2003 service pack 1. We are using a very basic smtp setup with a domain.

Here's where things are not basic; We have a lawgroup and they want everyone to be able to send email as the same user. we will call him ableandable@xxxxxxxx Well seemed easy enough. We gave domainusers full mailbox rights and send on behalf rights to the user ableandable. We then added this mailbox to everyone's outlook. If they want to send an email as themselves they just send an email. If they want to send an email as ableandable@xxxxxxxx they just click on the from box and select ableandable.

This works great however there are two problems.

1. When sending an email as ableandable@xxxxxxxx and not as themselves, the email when read by the recipient says in the from line "From John Doe

Re: Exchange 6.5 build 7638.2 (NOT send on behalf)

[johndoe@xxxxxxx] on Behalf of ableandable [ableandable@xxxxxxx].

We do not want it to appear this way. We want it to appear as the email actually came from ableandable@xxxxxxx not on behalf of.

2. When sending an email as ableandable@xxxxxxx and not as themselves sometimes the email will not go through to certain recipients outside of the domain. It returns with an error "message did not reach all of the intended recipients because I do not have permission to send to this recipient" But if they try to send the same email to the say recipient as themselves it goes through!

We know we could make ableandable the default email for everyone and make their individual email "send on behalf" as a temp fix but his is not the answer.

Any ideas?
