Hi Rich,

Again thank you for helping.

I am following your advice and have removed the deny send as from the security group I created, in hopes that we can resolve this.

I also read the article, <http://support.microsoft.com/kb/912918/>, you referred to, and don't understand how it relates to my issue...can you explain further?

I have also installed MS06-029 security fix, twice, and the build still reports as Version 6.5 (Build 7638.2: Service Pack 2), not sure what is going on there.

As far as where I checked the permissions: AD in the default users OU as well as in Exchange at all levels, after doing the showsecuritypage reg tweak...are there other places I should be looking?

As a temporary work around I created a Security Group named "Security – Mail Send As", then added the group to the top level of the Exchange Server with deny send as permissions, I then added all of the applicable users.

You really shouldn't do that. You'll cause problems for those users (e.g. they probably can't assign a task to someone else).

Re: Send As permissions set on all users, need to remove!

I read the article you're referring regarding the change in "Full" permissions, and possibly misread it thinking it didn't apply to me...please advise.

The change was to the way Exchange determines if the Send As right should apply to the user. Read this KB article for (alot) more information:

<http://support.microsoft.com/kb/912918/>

Version 6.5 (Build 7638.2: Service Pack 2)

You haven't installed the MS06-029 security fix. IIRC, that would have moved you to 6.5.7650.28.

I also checked the permissions on the "Everyone" and "Authenticated Users" groups and they are ok.

Where did you check? With the build of store.exe you're running you can inherit permissions (incorrectly) from the Exchange objects (in the Configuration naming context), or you can inherit them from "normal" inheritance in the Domain naming context.
