Can Query-Based Distribution Groups within Exchange 2003 be used to email all the members of a (non mail enabled) security group? It would be really handy for me as a system admin to email all the members of a security group who use certain applications very occasionally, without having to mail enable the group. I was wondering if you can do this using the QBDGs feature. I have just played with it, and it did not work – but it is entirely possible that I did something wrong? Incidentally, my domain is 2000, even though the Exchange server is running W2K3 and Exchange 2K3.

Any thoughts?

Thanks,

QH

I'm not seeing a way to make that happen because of the attributes that the QBDG looks for. Mind you, I'm in 2007 so it might be a little different in 2003.
