Very Possible, have you tried recreating the cert by running the Internet and Email Wizard? You could also try before recreating the cert, to uncheck require SSL on your Exchange Virtual Directories. If this works then the cert is most likely the cause.

SBS 2k3 is up to date. OWA has always had errors dealing with outside requests(anything outside our internal network). When I login internally through the OWA interface, everything works great. If I try from outside, I get a 404 error. The strange thing, all I have to do is remove the "/login.asp" portion of the address and then it will continue to the user's mailbox without any more problems. The only guess I have is that it is due to a certificate error. I have a self generated certificate on the server, which gives me certificate warning errors when connecting from outside the network. This doesn't prevent me from doing anything though. I just have to accept the certificate. Anyone have an idea what's going on?
