Any chance your SPAM-filtering solution can help you out here? I'm pretty sure that ours would see inbound emails to an invalid address as a possible directory harvesting attempt, and we've configured it to drop those emails without reply. Obviously it's not SPAM you're worried about here, but the end result is what you're looking for just the same.

Hmmm, the issue is that we don't want the disabled account to receive email.
Furthermore, we also don't wish for the sender to receive an NDR when they email the disabled account. That hotfix is for the NoMAS issue and is already applied to our servers. Any other ideas?

We need to make it where disabled AD accounts can no longer receive email.
We've tried delivery restrictions, etc. but an NDR is returned to the sender. Is there any way to disable an account without sending NDRs back to the sender?
