Just notice in my post that the Process should have been EMSMTA.EXE

Any suggestions are greatly appreciated!

Just started receiving this error in my Application log. This is appearing on my BE server.

Event ID: 2114

Source: MExchangeDSAccess

Description:

Process EMSMTS.EXE Topology Discovery failed, error 0x8007077f

Configuration:

1 Front End Exchange 2003 with SP1.

2 Back End Exchange 2003 with SP1.

I have checked AD Sites and Services and everything appears correctly configured. In fact, after I up the logging on Exchange, I started receiving Event ID: 2080 that lists the correct DCs and GCs in my site.

In-site:

SRV001.mydomain.xxx CDG 7 7 1 0 1 1 7 1

SRV002.mydomain.xxx CDG 7 7 1 0 1 1 7 1

This configuration has been running for nearly a year without any problems of this nature. Also, dcdiag, netstat, etc on my DCs report no problems.

What am I missing; ideas?

Regards,

Michael
