Do you have an Internet DNS entry with the hostname? If so, change that one. If not, I'm not sure where your problem is occurring. To help you more I'm going to need to know how your DNS is set up.

rejected

HELO from

mail.abcdomain.com

[IP

address]:

syntactically

invalid

argument(s):

exchange_server.mail.abcdomain.com

underscore

is not a

valid

character

for

hostnames

– therefore

we are

rejecting the

message.

they must

remove the

underscore

from their

hostname

before we

can accept

mail from

them

This is an

Exchange

2003 server

and I'm not

able to just

rename the

server

obviously.

Could I

resolve this

issue by

Yes I changed this setting. When you telnet into the box it responds with correct host name but I guess when it communicates with this UNIX server it is showing the full name.– Hide quoted text –

Should I create another DNS entry or cname internally for mail.domain.com? I guess I'm not sure how this would change how the mail server communicates with another server. When it announces itself it is passing the host name. I figured this was part of the intelligence of the information store.– Hide quoted text –

I have an A record and Reverse record created for the mail server "mail.domain.com. The mx record points to Postini for spam filtering This is displayed correctly when telnet into the server. The problem the unix server is having is the fact that mail server's local host name Exchange_server and this is displayed within the message header under the message id. Is there a way to remove this from the message header. Below is the header information.

Microsoft Mail Internet Headers Version 2.0
Received: from canit.colo.com ([206.127.30.2]) by mail.mydomain.com with Microsoft SMTPSVC(6.0.3790.1830);
