I have a second virtual server setup via System Manager. I then went in through IIS Admin tool and did more advanced configuration such as adding SSL to a specific IP address, host header for a different IP address, etc. so that I can have two "http virtual servers" that use two different SSL certificates (we are in the process of migrating domains and we use Treo 700wx's).

It works great for several hours... but then, for some reason, all the SSL, host header configuration, etc. for the second HTTP virtual server disappear and it stops listening on 443 at the specified IP address. It almost seems like it is being reset back to the default at random intervals by

Re: HTTP Virtual Server Loses Settings

Exchange

management.

Any ideas?

Thanks,

Chris

You mentioned host headers, but host headers don't work with SSL (because the request is still encrypted at the stage that IIS is trying to work out which site to send it to). Your Default Web Site and the extra site must have different IP addresses and/or different port numbers. It sounds like you are using port 443 for both, so your Default Web Site can no longer use the 'All Unassigned' IP selection. Pick one IP address for the DWS and another for the extra site.

Lee.
