Hey all...right now we have one Exchange 2003 sever, and I have been tasked with creating FE servers for OWA. This is not a problem, but they also want another FE server in another physical location to act as a redundant OWA server. So if one goes down, the other picks up. I am not sure how to do this, or if it's even possible. Any advice would be helpful...thanks!

Same URL? Different URL?

Connectivity between the two?

Is there a DC in the same place as the proposed FE?

Why do they think a FE is going to go down but not a BE?

.
