Your firewall is blocking ehlo verbs.

SMTP mail cannot be sent or cannot be received in Exchange Server

Hello,

We are having trouble with certain messages delivering to other domains on the Internet. A telnet test from the Exchange server to multiple SMTP servers (mx3.hotmail.com, etc.) show the following and will not accept HELO:

220

```

*****_*
*****_*****
*****_*****
*****

```

I understand this is because of a firewall issue. My question is: Why does some mail deliver correctly and other mail sits in the queue... unable to make a good connection to the receiving SMTP server.
