Hi,

I found something. You have to create a new SMTP connector on your routing group, in this new connector you can limit what domains that are allowed to sent to.

How do I limit it's ability to send to only one domain? I don't see any where in the virtual server configuration pages.

Hi,

I think it should be possible if you create a second virtual smtp server which can only sent to one domain. Then just allow the relay on this Virtual smtp server and it should be ok.
