Hi,

This means that there is an object in the current offline address list being referenced that was not found in the active directory. The object may have been deleted, mail disabled or moved to another container in a mixed mode environment. This is also a possibility that there may still be an object in the active directory that still has a reference to that PDN, however it is not in the current offline address list and is no longer in the PDN table for this OAB. This object can be any mail enabled object (Public Folder, Distribution List, Contact, etc).
