Thanks, did all that already.

Found the issue to be syntax. When using Set-MailPublicFolder I used \pathname, where I should actually have been using the alias.

All working now

Also need to mail-enable Public Folders – they aren't by default. This is done using the Enable-MailPublicFolder command:

HOW TO: Forward mail to a Public

Hi,

Created new PF OK:

Re: E2K7 PF Add email alias

- 1) Get-MailPublicFolder "\PF1" OK
- 2) Want to add a SMTP address to the folder:

- a. Tried Set-MailPublicFolder -Identity "\PF1" -PrimarySmtpAddress P...@xxxxxxxxxxxx , but of course I 1st need to disable email address policy
- b. Set-MailPublicFolder -Identity "PF1" -EmailAddressEnabled \$False , this produces the following error:

Set-MailPublicFolder : A parameter cannot be found that matches parameter name 'EmailAddressEnabled'.
At line:1 char:86

** What's up with this??? Any ideas welcome...

Tx
