here is your script, all you need to do is to change the server name to your mail server name, and run it

<http://smtp25.blogspot.com/search/label/Scripts>

Copy and paste the entire code into notepad

Change the server name, into your server name (ServerList = Array("server1", "server2", "server3"))

Save the file on your Hard drive as mailboxCount.vbs (c:\ mailboxCount.vbs)

Now go to command line

Drill down to same directory (c:\ mailboxCount.vbs)

Run the file by typing, c:\ mailboxCount.vbs

best

Upon further reflection, I figured out how you can execute such a query. It should look something like this:

```
(&(objectClass=user)(homeMDB=*)(!(msExchOmaAdminWirelessEnable:1.2.840.113556.1.4.803:=2)))
```

You need to find all users in AD with the attribute msExchOmaAdminWirelessEnable having its 0x2 bit clear. (The bit being set means the feature is disabled, which is backward from what I would infer from the attribut name being "...Enable"; go figure.) Because we're looking for a single bit being clear, I can't see a way to do this in a single LDAP query, so what I would do is query for all users (or some subset you want) and then iterate through the recordset and look at each value of this attribute for the desired bit setting.

How can i list out all the users in a AD that has enabled outlook mobile access on exchange in a vbs script?
It Should be possible, but i have problem finding it out...
