Ed, I have referred this link. Please see below. I followed all the steps as per this, as a test I also configured the IMAP client on outlook 2007 but again I am unable to send emails. It sits in outbox, it also happens in iPhone. Please advise.

If the iPhone is an IMAP client, then it should work. You haven't provided any details how you've configured iPhone users to connect, so I can't comment on why they might not be working.

Ed, we are using outlook for all clients and everything works fine inbound and outbound. However, the reason IMAP is configured so that iPhone users can do send/receive emails, but the problem we are having is currently iPhone users are unable to send emails. Please advise if any solution to this.

"Ed Crowley [MVP]" wrote:

Outlook really works better when using MAPI; IMAP is a much less functional protocol.

Re: Setting up IMAP on exchange 2003 server

Are the Outlook clients configured to authenticate for sending outbound mail? Using the same credentials as for downloading the mail should be fine. Is Outlook sending mail to the same server?

Can you tell me how do I configure smtp so that all my IMAP clients can send email. Currently outlook is configured for IMAP. All IMAP clients are unable to send emails and sits in outbox. Please advice.

"Ed Crowley [MVP]" wrote:

I've never seen a client that supports a secondary SMTP server.
