Hi,
Thanks for the quick response :-

What's your disk config?

I have 1 disk partitioned into 4 (a 55mb FAT EISA config, C, NTFS 10gb boot partition, d: 59gb NTFS Pagefile partition, and e: a 68gb system partition. 85%,52%,73% and 10% free respectively. All PARTitions are of a BASIC type and are Healthy.

Were users *not* experiencing any problems before you upgraded the RAM ?

Yes, This problems was not around before the RAM upgrade.

What SP on Exchange?

Sorry, been trying to find this out, but not having much luck. Any ideas were I can find this information for you?

What version & SP of Outlook, and are your users in cached mode?

were are using 2002, 2003, and my new laptop has 2007 (all having the same problem).All bar one user is in cached mode (I turned the other one off to see if that "cured" the problem, but no joy).

All machines are fully Service packed up and are Running Windows XP.

Thanks again, and I hope the information I could give you helps.

Gerald

Hi,

I have a Windows 2000 Server which has just been upgraded to 4gb, since then, users have been getting the message that " Outlook is reteriving data from {exchange Server name}".

I've got the users to empty down ther Inboxes and folders,empty there recycle bins and I've compressed the mailboxes, but I still get the same message.

I know with other versions of the Windows 2000 server (Advanced, datacenter and Standard edition)

No, not Standard...

you can go into the Boot.ini and add the /3GB switch, but is there something similar I can do with my server version, or is there another way to stop this mesage from appearing?

System Properties :-

Microsoft Windows 2000 5.00.2195 with Service Pack 4

Intel (r) Xeon CPU 2.40Ghz AT/AT Compatible

3,931,632 kb Ram

Many Thanks in advance for your help

Don't use the /3GB switch
