Good afternoon!

Quick question. I have a single Exchange 2007 (not yet SP1) server-environment. On the receive connectors I have the following permissions groups and authentication methods:

Default <servername>

Permissions Groups – anonymous

Authentication – TLS checkbox, but not the one underneath that  
Basic Authentication and the one underneath that  
Exchange Server Authentication  
Integrated Windows Authentication

Client <servername>

Permissions Group – Exchange Users

Authentication – same as other, only no Exchange Server Authentication

Is this correct?

Thanks,

Cary
