Yes I checked it it's about 3 Gbyte I know that's not much but the strange is that the other archive is working fine.
Thanks

From a few days the Exchange server, 2003 on SBS W2K3, gives me some strange result, the first one is the inability to access by users on the public folders, we aren't to mount the archive of the public folders. The database is not installed, and when I try to install the archive The answer is always the same: Internal error processing. Try Restart the Exchange System Manager ID: c1041724 In the eventlog: Error 0x80004005 starting database "First Storage Group \ Archive public folder ..." ID9519 from the MExchangeIS service. I installed the SP2 Exchange and all the patches of the system, the server is a SBS2003. I tried to use the utility eseutil with the database but that's seem correct, I also tried to create a new public folder and mounting over it the original db of the first group of public folder, the db works (I can see the internal structure) but when I try to access from Outlook nothing to be done because the service MExchangeFBPublish shows the error: Error initializing session for xxxxxxxxxxx virtual machine. Number of error 0x8004011d ID 8197.

Re: Can't Mount Public folder Archive

I'm start to be crazy! Some suggestion?

Thanks

PS:

I tried with the suggestion of:

KB 930241;

KB 316709;

use the polycytest – with no error of the answer (correct authority);

move the database, and logs, in another disk – no mount;

delete the logs file;

use eseutil for defragmentation and soft repair of the DB – all correct.

I don't have more ideas I hope that someone could help me.

Thaks for collaboration and king regards

Stefano
