We are trying to use get-mailbox to list all users in our forest. The way AD was setup was that we have a parent domain and 3 sub-domains. When I run get-mailbox, I get all the mailboxes from our parent domain, but none of the subdomains. When I run get-mailbox and specify a domain controller for one of the subdomains, I don't get all of the users in that subdomain. For example, I only get 220 out of 242 users on one of the subdomains.

An example of our domains are

ny.domain.com
ms.domain.com
ar.domain.com

we also have users in domain.com

At one point I came across the command to type into the exchange management shell. For the life of me, I can't find it.

Thanks,
Robert

Try it with the IgnoreDefaultScope switch.
