Just realized this is by design. "Exchange controls access to folders based on the Microsoft Windows NT Security ID of the user who is logged on" If you open up ESM go to the public folder properties, permissions tab and do a ctrl+left click you can see how Exchange grants access by mapping the mailbox granted to the Windows account. You can add the NT user this way but it "May" break the ability to grant permissions the normal way. I remember it breaking before but testing now it didn't.

Access control lists in Exchange public folders

I can confirm Exchange Domain Servers and Exchange Enterprise servers groups exist on the child domain. I have also enabled logging as suggested and tried to access teh calender from a dev account, but I cant see any comments on this in exchange logs or Application logs in events viewer i may be looknig in the wrong place?

"Jamestechman" wrote:

Can you verify that an Exchange Domain Servers and Exchange Enterprise Servers group exist in your dev domain and contains your Exchange server?

Also can you enable diagnostic logging for public folder\logon and access control and see if your app logs show anything after the dev users attempt to access the calendar?

Hi James,

Thanks for your response, The dev users are logged on to there workstations with there Dev accounts which access there company.local mailboxes, if the Dev users logon with there comapny.local account then they can see the calender ok.
Domain Prep has been run on the Dev domain.

Many thanks Richard

Re: Child domain public folder issues

The dev users can't see the calendar using their company.local account \mailbox? Or is it the dev users account in the dev.company.local that has a mailbox? If it's the later; did you run domainprep on the dev.company.local? Although it does not contain an Exchange server; you need to run domainprep on domains that host mail enabled users.

Hi
We have an
all winodws
2003 setup
and we have
the main
domian
(company.local)
and a child
domain for
the
developers
to use
(Dev.Company.local)

The
Exchange
server is in

Re: Child domain public folder issues

the
company.local
domain,
there is no
exchange
server in the
dev domain,
The
developers
log in to the
Dev.Compnay..local
domain as
all there
delevopment
servers are
here, they
then have
an account
in the
compnay.local
domain
which there
Dev
accounts
have
permisson
to the
mailbox' s
this all
works ok,

They have
requested
Public
folder
calender for
both Dev
users and
company
users, So
we added a
Public
folder
calender
and gave
permisson
to the
Developers
company.local

Re: Child domain public folder issues

accounts as
well as the
required
company
staff, The
company
staff can
connect fine
but the Dev
users cannot
see
anything in
the
calendar,
I'm sure this
is
permissions
but you can
only had
permissions
from
the global
address list
which does
not contain
the Dev
account
(plus they
don't
have email
addresses)
Is it a case
of creating a
new address
list?

any help
would be
much
appreciated
