Ah – but you've multiposted, it seems, not crossposted. The latter is preferred (post a single message to multiple (relevant) groups by separating the group names with a comma – so that way everyone can follow the thread.

Can you not change this? Sort of defeats the point of a centralized mail server.

Why not just forward it?

Aside from resolving it by clicking forward on the message in question, I'd ditch POP and host all the domain's mail on the Exchange server. Solves this and myriad other problems. It's also really easy to set up. Need help?
