Administrator group access is "deny" by default and is inherited. If you add an explicit grant permission it will override the inherited permission. That is what you did when you added your own accounts. Just add the group in the same way. Its all in the documentation. The permissions can be added at the SG level or at an individual account level.

Okay,

It looks like I have it working for now. It seems that the "group" that I gave "Service account" admin rights to is not working on the "moved" DBs for some reason. Even though the group is on the security tab with "full" rights.

I went ahead and just added my AD account to the security tab and gave it "full" rights and everything started working. If anyone has any ideas on how to get the group working again that would be great. I will try (at a later time) to delete the group from those DBs and re-add the group and see if that fixes that problem.

Thanks for everyone's help.

Clayton

Hey Betelgeuse,

I checked the permissions on all the DBs and they seem to be the same. That's what's getting me. It "looks" like "Service account" admin rights are already on those problem DBs.

Re: Help, I moved mailboxes and now can open boxes using "Service account admin" rights

TIA,

Clayton

Hey everyone,

We are running a Windows 2003 domain and Exchange 2003 sp1 on Win2k3 in a cluster. We had ONE storage group and 4 DBs. I have a AD group that has Exchange "Service account admin" rights and people in that group could open ANY mailbox. I am in that group too.

Over the weekend we created a NEW storage group in Exchange and MOVED tow DBs from SG1 to SG2 (the new SG). Now I can't open anyone's mailbox that is in the new SG. The users are working fine. They can connect to their mailboxes using Outlook 2003 just fine. However, I am troubleshooting a BlackBerry issue and need access to the user's mailbox.

TIA,

Clayton
