BTW – I have tried domain\username usernam@domain etc. I can log in as just plain old administrator and password – no domain info so I think it is a rights issue.

I also tried using IP address instead of mail server name only thing that works so far is administrator.

I get no error messages in the event viewer.

Hello,

I'm running an Exchange 2003 SP2 server on a Windows 2003 SP1 AD server. We don't have another front end mail server – just that server with direct e-mail access. POP3 used to work but now when you try to log in using POP3 it will prompt you for a username and password for incoming server. The user's info won't work but if you put in the administrator's info at that prompt it does work.

I checked under AD, the users have rights for POP3 and IMAP under their individual rights – not sure where else to check.
