Hello Patrick,

If Imail uses an LDAP directory and IMAP4 mailboxes, then you can use the Migration Wizard that ships with Exchange 2003. You will need to migrate the directory first. You will select this option from the Migration Wizard, 'Migrate from Internet Directory (LDAP via ADSI)'. Once you have migrated the directory, you can then migrate the mailboxes. You will select this option from the Migration Wizard, 'Migrate from Internet Mail (IMAP4)'.

If Imail is just a POP3 server, then you can just download the messages using a POP3 client like Outlook or Outlook Express. With Outlook Express, you can then export the messages to Personal Folders (.PST).
