I'm having a problem getting my Outlook 2003 clients to see our Exchange 2003 standard server. When I create the profile I get the following error when I "Check Name": "The name could not be resolved. The action could not be completed."

MachineA (Windows 2003 Server) is the exchange server and also hosts external DNS and runs VMWare. VMWare runs MachineB (Windows 2003 Server) which is the DC & GC and hosts DHCP & DNS. MachineA points to MachineB for DNS and all desktop machines (Windows XP Professional) point to MachineB for DNS.

We are moving from a linux solution (Postfix & CourierIMAP) to Exchange but can't get past this hurdle. I've searched google as well as these newsgroups and have tried numerous suggestions but none seem to work for me.

Any suggestions are GREATLY appreciated!!
