Can RPC over HTTPS in Outlook 2003 be created without RPC, for FE-BE environment?

If I have a new remote XP client, can I send him a Outlook 2003 disc and expect him to connect?

If so, please explain how, because I've been testing and can't make it work.

Do I need to send him a certificate? I did not have to do anything with a cert for my RPC over HTTPS clients which initially connected to Exchange on a LAN, and as a domain member (does that matter?).

Should he use the same URL/virtual server I use for OWA, or should I create a new one?

We've setup a test XP box with only Outlook 2003 installed and connected it to the internet but after creating the profile we get a message that exchange but be started while online, etc...

Thanks for anything you can share.

Thank you
