Jaclynn,

Thank you again for responding with further help.

What I have now done is: Search through the old data and found the dir.edb that you referred to and have now copied it into it's respective directory within the exchsrvr folder. (/exchsrvr/dsadata/)

Now after rebooting the server and trying to access the exchange server (using Exchange Administrator) I am getting the following error:

Can not establish a connection.

You do not have the permissions required to complete the operation.

Microsoft Exchange Directory

ID no: DS_E_INSUFFICIENT_ACCESS_RIGHTS

I'm assuming this is because the old database file also stored the administrators old password? As this is only a test server I have been using a new "dummy" password, will using the old password work? (I'll test that next) or is there another way of getting permissions back? I checked the administrators permissions in Active Directory for Users and even made the administrator a member of ALL groups (which didn't help).

Thanks again for your continued help and thanks in advance for any future help... (greatly appreciated).

Regards,
Eric Sambach
