I'm trying to setup seucre exchange 2003 web access, (running on a windows 2000 server)

I'm going to create my own certificate instead of purchasing one...but I'm already stumped. When installing certificate services what do i want to choose? Enterprise root CA, enterprise subordinate CA, stand alone root CA, stand alone subordinate CA?

I want users to be able to securly check their email from any remote computer....is there any guide that detials on creating your own certificates for exchange?

thanks
