You are missing SID history on the new accounts.

The Migration Wizard is trying to either create a new account in the new domain for the mailbox data your are migrating, or it is trying to find an existing User account in the new domain that has a SID history that the mailbox is associated with.

The easiest solution if your users are not already using the User accounts in the new domain is to simply delete them and let MigWiz create new ones for you.

Or you could leave the existing accounts in the new domain and let MigWiz create new ones when it migrates mailbox data, typically with a -1 appended to them. Then after this you could:

- delete the new accounts

- This will leave the migrated mailbox data on the new E2k3 server for 30 days.

- Go to the mailbox Store on the new server, select the mailbox store, right click, select run cleanup agent,

(this will result in the mailboxes appearing with Red Xs on them, indicated they are not connected to User accounts)

- now you can select the mailbox, right click, choose Reconnect, and select the User account you want to associate the mailbox with

You can test this process with a test mailbox or a live one since MigWiz leaves data on the 5.5 server anyway.

328871 How To Use the Exchange Migration Wizard to Migrate Mailboxes From an <http://support.microsoft.com/?id=328871>

842762 The "Exchange Server 2003 Deployment Guide" guide for Microsoft Exchange
<http://support.microsoft.com/?id=842762>

Of course you will need to create new User profiles on client machines for the new domain and create new Exchange profiles for Outlook.
