I'm trying to setup Exchange 2003 in the following environment:

- 1 Access Internet email sitting on ISP server
- 2 Send email via pop connector
- 3 route internal email

So far, pop connector works fine and Internal email work OK. However, when using E-mail & Internet Connection Wizard, I get an error and the end of the wizard.

In the setup steps I choose the following:

- 1 Enable Internet e-mail
- 2 Forward all e-mail to server at your ISP
I use the SMTP server address provide by my ISP (which is the same one I have been using in Outlook for years)
- 3 E-mail Retrieval Method (Use the MS Connector for POP3 Mailboxes)
- 4 E-mail domain name (Blank)
- 5 Added POP3 Mailbox Accounts

When I click "Finish", I get an error message and then select OK. On the Wizard window, all of the steps get a check mark except "E-mail Configuration".

Please note that I can ping the ISP's SMTP server but not telnet to it. If I try to telnet, I get a "could not open connection to host on port 23: Connect failed" message. Any guidance available?

.
