Ok, thanks,  
I solved it by installing an extra CAS server and using this server for the migration.

regards

HiThierry,

I have this problem too, Did you solve it already ?

regards  
Jeroen

Ok. From the release notes:

If Transporter returns the error "Could not retrieveE12WebServices URL", use the -ClientAccessServer parameter in

Re: Could not retrieve E12 webservice url

the Move-DominoMailbox cmdlet to identify the Client Access server running WebServices.

FYI -ClientAccessServer parameter does not exist... You should replace the argument by -TargetClientAccessServer...

I used my own certificate authority and now the problem is different:

```
PS C:\> move-dominomailbox
'CN=USER/O=CUSTOMER'
-DominoDirectoryServer
'DOMINO/ORG
'-DomainController 'DC.DOM.LOCAL'
-TargetMailboxDatabase
'EXCHANGE\First
Storage Group\Mailbox Database'
-TargetMode 'Merge' -TargetClientAccess
Server 'EXCHANGE'
```

WARNING: Encountered a SoapException for the probable EWS URL (<https://exchange/ews/exchange.asmx>). Please validate the EWS configurations. Error details: ErrorImpersonationFailed Ichech de l'emprunt d'identiti. Move-DominoMailbox : Could not retrieveE12webservice url.

Any help will be greatly appreciated !

Found this: <http://forums.microsoft.com/TechNet/ShowPost.aspx?PostID=1401758&Site....> but I don't know where to check using adsiedit.

Re: Could not retrieve E12 webservice url

Thanks

Hi,

I get this message when  
using lotus transporter suite  
to migrate a  
mailbox. I was able to  
synchronize directories  
between Domino and Active  
Directory, to create accounts  
based on Domino accounts  
but I cannot  
migrate a mailbox. I guess  
the problem is related to the  
autodiscovery  
process but I didn't found  
anything usefull on Internet.  
I get the same  
issue with the command  
line. Is there a log created I  
could check ?

Thanks in advance

Thierry

P.S.: The server is running  
Windows 2003 R2 64 bits /  
Exchange 2007 Std 64  
bits– Masquer le texte des  
messages pricidents –

I found a solution. I first migrate the domino account to a NEW Active Directory account (I check the option to create a mailbox too). Then I can migrate the mailbox to Exchange 2007. I disconnect the mailbox and I reconnect it to the original Active Directory account. I have to use the cmdlet to grant full mailbox permissions to the mailbox for the original user. It works fine.

I found also a problem in the permissions in Active Directory. You can use adsisedit to check the permissions at the server level. You will find a lot of deny in front of the impersonation right. In fact, I used the administrator account. As this account is member of "domain admins" and some other security groups (which are present in the ACL at the server level with adsisedit), you'll find that the deny options are set on the groups the administrator is member of (the impersonation right was correctly set on the administrator object but all the groups the administrator is member of have a deny for the impersonation right).

This was the same problem with Exmerge (with Exchange 2003) if you wanted to use the administrator account (you had to uncheck the deny options for the administrator account, the domain admins groups, the enterprise admins groups, etc. at the org level).

I opened a case to PSS and for your information, a bug was found if you are doing a migration with two forests (one forest to host the mailboxes, one forest to host the accounts). A fix will be probably done. You get the same error message.
