I've completely performed a disaster recovery of an Exchange 2003 Enterprise server, which is also the only domain controller.

Now I'm trying to install Exchange 2003 Service Pack 2, but I receive the following error message:

Setup failed while installing sub-component Miscellaneous Atom with error code 0xC0070003 (please consult the installation logs for a detailed description). You may cancel the installation or try the failed step again.

Could anyone please advise me what to do to fix the problem?

I think it might have something to do with WMI?

Thanks in advance!  
Edward

So go through the `exchangesetup.log` (probably in the root of the `c:\` drive) and read it. You may want to post a small section of it here. Please don't post it all. Read it carefully.
