Hey

Had a working setup like this

Internet (80.62.xx.xx) => Router (NAT) => Exchange Server
(192.168.1.12)

This worked fine. But then my firewall/router was fried in a thunder storm :(

Ok. I then added another Network card to the Exchange and enabled DHCP, DNS and NAT so my setup now is:

Internet => Exchange Server (WAN NIC 1– 80.62.xx.xx) & (LAN NIC 2 – 192.168.1.12).

Now the client goes through the Exchange server 2003 which is now also a router. This works. But now i cannot receive mails anymore. I know my a-record/mx records are correct since they worked before I changed my internal setup. My SMTP is working fine (i can send mails).

The Exchange server Queue is completely empty. The funny thing is that when i send mails to the server i never get an error mail back. (I can send mails internal in the exchange server).

I have no idea how to "troubleshoot" this issue. Any ideas?

.
