I need some help here. . I have 3 users that have laptops with Verizon Air cards. When I setup the laptops to use our Exchange Server's SMTP and they try to send email – I get the error that our server does not allow Relaying. I do not want to turn on relaying!

Is there a way to setup the Exchanges Server with a secure login to the smtp so that we can send email from anywhere our mobile users may be?

Thanks

Ron

.
