I also thought that the Restore LUN could be used for maintenance run isinteg or eseutil. The storage calc removes the extrac disk required to run these utilities if you say Yes to Restore LUN.

Is this true?

"Oliver Moazzezi [MVP]" wrote:

We built a recover LUN into our designs, but changed it from the Storage Calculators recommendations. We know we're only going to restore a database (we aren't talking DR here) if a customer requests old data that's been deleted and they aren't on a Journal Store. So we just used a chunk of RAID5 storage.

I guess it depends if you are planning on using it for your DR purposes of a database restore, and plan to switch over to the restored database (you can in Exchange 2007), and them merge your 'dialtone' one into the larger restored store.
