You mentioned that you're in mixed mode. Are the delegate accounts in AD? Are they enabled or disabled, and if they are enabled, were they disabled when you migrated them from 5.5?

There is a known case where permissions get reset. If you started out your migration process by creating disabled user accounts in AD, then enabled those accounts, make sure that the process that enabled the accounts also cleared the msExchMasterAccountSid attribute. This attribute only has a value on disabled accounts. If it has a value on an enabled account, you'll see odd behaviors like resetting permissions.
