Open ADSIEdit. Expand the Configuration container. Then, in order, go into the Configuration, Services, Microsoft Exchange, Organization name, Global Settings, Message Delivery, Default Message Filter properties. In the properties page, it will list all the attributes. Scroll down the list until you see msExchTurfListNames. View/edit the properties of that object and you should see a list of all the names. I doubt it will be easier to read, and I don't think that you can easily export that information (at least not using ADSIEdit).
