..

Here are the configurations:

1. Exchange 5.5 SP4 running on Windows 2000 SP4.
2. First Exchange 2003 SP1 server, which is running ADC and SRS joined to Exchange 5.5 organization.
3. Second Exchange 2003 SP1 server as mailbox storage server joined to Exchange 5.5 organization afterwards.

Population of NT 4.0 to AD and ADC are all working fine.

Moved mailbox to the first exchange 2003 (master), all the incoming/outgoing and internal/external communication are all OK.

When I move mailboxes to the second exchange server. Exch 5.5 client can send email to exch 2003 client without a problem and external incoming/outgoing email work fine as well.

But when I am trying to send emails to an exchange 5.5 client, from an exchange 2003 client. turned on email tracking on exch 2000 box, and get the following "message rerouted to site connector <domain> (originally unknown). It's getting sent to the right NT4.0 domain (so it seems), but the exch 5.5 client never sees the email.

I checked the queue on the Exch 2003 side, all of them are stuck in the X.400 Exchange MTA outgoing queue. The queue state is showing as retry instead of ready.

Urgent! any ideas would be greatly appreciated.
