Hi.

I have an e-mailsystem that consists of MS servers in the backend and other servers at the gateway to internet. I would like to know how to measure the time it takes to deliver a mail from my Exchangeserver to Internet.

kindly

MN

Well, each message will be different based on loading and bandwidth so measuring it might not be much use.

Message Tracking would help you look at a sample set of messages and view the time each message took.

Apart from that I'm not entirely sure what you're looking to achieve.
