Programmatically update Free/Busy Information via CDO or MAPI?

We have an App that creates Appointments in User A's Calendar. Though if User B goes to see if the User A is available for another meeting our meeting does not show up in the Free/Busy data for User A until User A has opened outlook and either waited 15 minutes or closed it.

Is there a way to Programmatically update Free/Busy Information via CDO or MAPI?

Thanks,
Scott<-
