Can you release the message to an alternate address or location to see what it is? If its coming from Postmaster its mostly an NDR being fired back from Exchange from Dictionary attacks being performed by Spammers. Are you running Exchange 2003 SP2?

My Symantec antivirus for exchange keeps send me an email that says:

Location of the message: SMTP
Sender of the message: postmaster@xxxxxxxxxxx Subject of the message:
None

The attachment "pd75001944778.msg" was Quarantined.

This was done due to the following Symantec Mail Security settings:
Policy: Standard
SubPolicy: Exception SubPolicy
Rule: Unscannable File Rule

I am getting this about 20 times in a day. What is the msg that is being sent? Who would be sending it and how can I get rid of it?

Any help would be appreciated.
