Hi,

A user called michael@xxxxxxxxxxx send an email to another user caled jenny@xxxxxxxxxxx

They both are members of the domain and users and they could get each others emails.

There is someone else called enver@xxxxxxxxxxx He is a member of the workgroup but

not a member of the domain. He doesnt want to be a member of the domain because he

is getting his emails directly from ISP. The others are on exchange. If ahmet

or mehmet send an email to saffet, this email lost somewhere because saffet's email

is not on exchange. I think that email is not going on the internet because the extension

is the same, it directly goes from internal net. Thats OK but how can I send an email to that person? Saffet can send emails to his friends without any problem. There

isnt any problem on the emails he sent, very rarely it they came back.

Thanks to all the friends who intersted with that.

.
