Hello!

Our customer has a Visual FoxPro 2.6 database. At his Windows NT 4.0 workstations it is possible to import data from this database f. e. to Microsoft Excel. Unfortunately this import does not work on Windows XP workstations. If you try to create a ODBC DNS on the Windows XP workstations an error occurs: "You must first install the current version of the FoxPro ODBC driver".

I just searched google groups and found some answers. Unfortunately the website which is described in these answers <http://msdn.microsoft.com/vfoxpro/downloads/addons/odbc.asp> is not available yet and I cannot find an OBCD driver or anything else to solve the problem.

Does anyone know a solution for our problem? Thanks in advance!

Greeting from Germany
