My next suggestion would be the same as Carsten's. If you can't spot any pattern by looking at the data, you may have to use whatever export mechanism Symantec supplied. And the only option there may be printing to a file. You should be able to use the "Generic Text" printer and print to file.

Jack,

here is a suggestion which isn't especially fancy, but used to work since the old dos-days :-)  
Install a printer (generic text or so) on your system which "prints" into a textfile. Now "print" the notes and write a program to import the created text-files.

This is an odd post but I'm looking for any suggestions.  
Symantec had a french language p.i.m. called Organiseur in the early 90s.  
It has an export utility for the appointments but not for the notes. I'm trying to extract some of the notes data in order to import them into a VFP db and not having much luck. Does

Re: Data conversion

anyone  
have any recollection of this product?

Is there a better newsgroup for this post?

Thanks in advance,

Jack
